

Indonesia Solar Energy Outlook 2025

The rising importance of
solar energy in leading
Indonesia's energy transition

The Rise of Solar Power

Global and Indonesian Adoption of Solar
Energy

Global Solar Energy Adoption

Solar is projected to provide **43.6% renewable energy** by **2030** (Ember, 2024)

Global Solar Energy Adoption

G20 Countries Highlight

China	356 GW, more than half of global installations
India	33 GW, rise in auctions to meet 50 GW target consistently reaching USD 3/kWh
Brazil	28 GW, growth driven by distributed installations due to increasing electricity tariffs, net-metering, and credit schemes

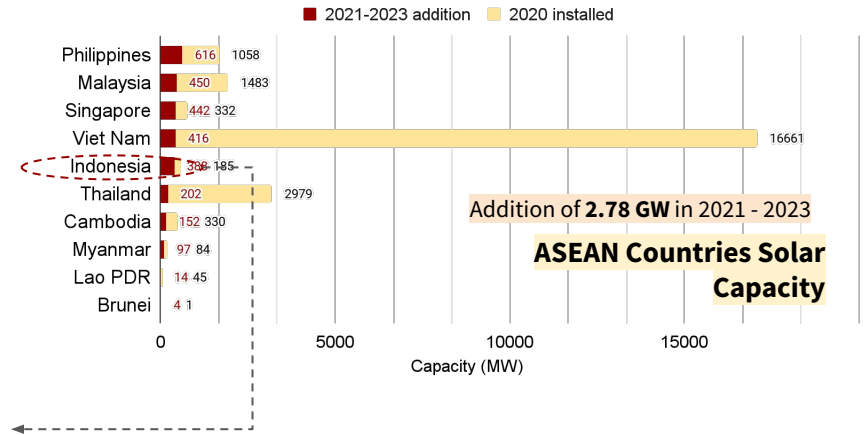

ASEAN Countries Solar Capacity

ASEAN Countries Highlight

Philippines	616 MWp, net-metering schemes and fiscal incentives
Malaysia	450 MWp, large-scale solar tenders (LSS)
Singapore	442 MWp, The Singapore Green Plan 2030 which prioritizes solar
Indonesia	388 MWp, all-high 260 MW new solar capacity in 2023

Adoption

Addition of **2.78 GW** in 2021 - 2023

ASEAN Countries Solar Capacity

Currently, utility-scale stands at 48% of total solar capacity installed, with Cirata 145 MWac being the highest addition in 2023

Utility-Scale
285 MWp

Distributed
245 MWp

Off-grid
56 MWp* (50 MWp)**

Captive
131 MWp*

Currently there are at least **718 MWp** of Solar Energy Capacity in Indonesia

*) Data from March 2024

**) Pra-electrification solar programs such as LTSHE, PJU-TS, SPEL-APDAL

Utility-scale Solar Adoption

- ❖ Only **1/3** of utility-scale solar projects **have been realized** in PLN's RUPTL by 2023
- ❖ Around **2/3** of the utility-scale solar projects in PLN's RUPTL are **delayed** by **1 - 3 years** by Q2 2024

Indonesia's utility-scale solar installed and target capacity, 2019-2023

Source: IESR analysis based on compiled sources of PLN, MEMR, and company press releases (2024).

Utility-scale solar power plant development timeline, Q1 2014 - Q2 2024

Project Name	Capacity (MWp)	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
Kupang (Oelpuah)	5	●	●●	●								
Sumalata	2	●	●●	●								
Hambapraing	1		●									
Jakabaring	2				●●	●	●	●				
Maumere & Ende	2	●		●●	●			●				
Atambua	1	●		●●	●			●				
Pringgabaya	7			●●●	●●●	●		●				
Selong	7			●●●	●●●	●		●				
Sengkol	7			●●●	●●●	●		●				
Likupang	21			●●●	●●●	●		●				
Isimu	14.5			●●●	●●●	●		●				
Kuta (Sambelia)	7.25			●●●	●●●	●		●				
Selayar	1.3									●●	●	●
Hybrid Sangihe	1.3									●	●	●
Hybrid Nusa Penida	4.2									●●	●	●
Cirata FPV	19.2						●	●	●	●	●	●
IKN*	10										●●●	●

Delayed Projects

Source: IESR analysis based on compiled sources of PLN, MEMR, and company press releases (2024).

*The target COD for IKN solar power plant is not listed in RUPTL, but rather the target stated by PLN Nusantara Power in accordance with the development of the new capital. Completion in February 2024 is for phase I only. COD for phase II is planned for May 2024, with a capacity of 40 MWp. As of June 2024, phase II is still in construction (EMedia DPR RI, 2024).

Utility-scale Solar Adoption

- ❖ Only **1/3** of utility-scale solar projects **have been realized** in PLN's RUPTL by 2023
- ❖ Around **2/3** of the utility-scale solar projects in PLN's RUPTL are **delayed** by **1 - 3 years** by Q2 2024

Successful utility-scale projects

A. Hijaunesia Projects: Successful equity auctions since 2019

B. Showcase Projects:

- 2018 Asian Games: Jakabaring project
- 2022 G20 Summit: Nusa Penida hybrid PV system
- IKN Development: 50 MW solar power plant

Barriers and Lesson Learned in Development:

A. Realization:

- Oversupply** concerns
- Grid immaturity:** e.g., 2017 sumatra solar auction
- Regulatory changes:** e.g., 2016 feed-in tariff auction

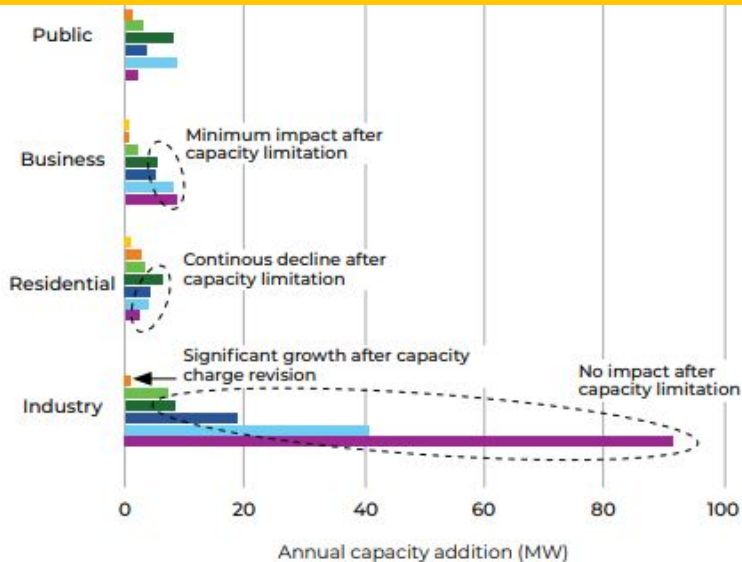

B. Delay:

- Unrealistic targets** in early RUPTL versions → e.g. Lesson learned PPA negotiations (1-2 years) and construction lead times (1-3 years)
- Land acquisition issues:** e.g., Sambelia project
- Capacity adjustments** requiring better demand forecasting and grid planning: e.g., Likupang project

Adoption

Key Insights - ANNUAL CAPACITY GROWTH OF 138%

- Major drivers and constraints of development is **regulatory-based** (removal of energy capacity charge, APBN & non-APBN prorams, capacity limitation, current policy) and **market for decarbonization**
- Large-scale installations in **industrialized** regions and small-scale installations in **urbanized** regions
- Grid reliability** (low SAIDI) has **easier permit approvals** and **higher adoption**
- There is still **untapped potential** in **high electricity consumption & low SAIDI** regions (e.g., Bangka Belitung, Yogyakarta, North Sumatera).

Off-grid and Captive Solar Energy Adoption

Current Trends:

- ❖ Globally, **solar** is increasingly used in **electrification** in **isolated areas**
- ❖ To electrify all its households, Indonesia has a substantial amount of **pre-electrification** programs (3.4% of electrification)
- ❖ But this classifies as MTF Framework Tier-1 due to limited power capacity and reliability -> must transition to **mini-grids**
- ❖ But for the past few years, **65 - 75%** of annual off-grid capacity comes from **mini-grids** (IRENA, 2023).
- ❖ Challenges in transitioning to **mini-grids**:
 - High connection costs of 20 times higher in 3T regions

Solar off-grid capacity by type, Q4 2018 - Q1 2024

Source: Data shared by MEMR (March 2024).

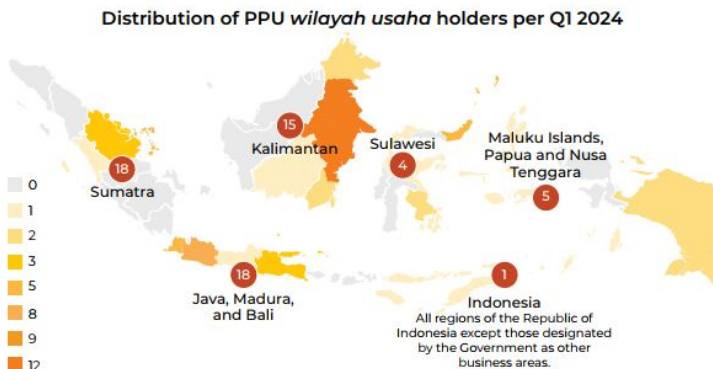

*) IESR estimation based on the shared data

Off-grid and Captive Solar Energy Adoption

Source: IESR analysis based on data shared by MEMR (March 2024).

Source: 2024-2060 RUKN draft (May 2024).

Wilayah usaha (*wilus*) has tripled since 2017.

There has been a **growing increase** of Private Power Utilities (PPUs) installing and permitting installation of **solar** in their *wilus* due to the **increasing ESG and green initiatives**.

Example: **Jababeka** Industrial Park:

- **21.2 MWp** of solar capacity in 2023
- **70% increase** from 2022

These are opportunities to:

- Making **green industrial parks**, for example, in *wilus* which are attractive for industries with NZE targets.
- **PPUs and *wilus* holders** can offer streamlined permits and ready grid infrastructure.

But there are challenges:

- Lack of **transparency** in system planning, data, and permitting in *wilayah usaha* domains.
- **Government mandate** needed to improve transparency for developers and the public - a positive development is **Simantap Application**

Plans

- **RUEN (2017)**
 - Solar energy projected to contribute only 3% of primary energy by 2050
 - Minimal role in achieving 31% renewable energy target by 2050
 - Helped leading to MEMR 49/2018 and MEMR 26/2021
- **RUKN (2019 - 2038)**
 - Solar capacity: 3 GW by 2030

- **MEMR x IEA NZE 2060 Roadmap (2022)**
- In COP-26 (in 2021) Indonesia declared net-zero by 2060 or sooner
 - Solar installation targets: 32 GW by 2030, 421 GW by 2060
 - Other scenario: 500 GW by 2050
- Increase in solar potential in 2021 from 207 GW stated to 3,294 GW (EBTKE, 2021)

- **KEN Draft (July 2024):**
 - Solar supply 1.6% of primary energy by 2030
 - Ambitious scenario: 32% solar contribution by 2060
 - Solar installation targets: 7 GW by 2030, 309 GW by 2060
- **RUKN Draft (May 2024):**
 - Solar installation targets: 14 GW by 2030, 134 GW by 2060

Utility-scale Solar Pipeline

Utility-scale solar project in the pipeline, COD 2024-2027

Source: Interview with PLN's DIV MEB, Nusantara Power (2023b).

Large-scale projects procurement

Hijaunesia Project
500 MW
Floating PV

Project X Nusantara
740 MW
Ground-mounted PV

Highlight: Floating Solar PV

Floating PV can spearhead utility-scale solar capacity addition in Indonesia

1

Cirata's Success Story

- FPV pilot project
- 145 MWac/192 MWp
- Largest FPV in SEA
- Largest utility-scale solar power plant in Indonesia

2

Avoiding Land-use Issues

- Mostly on PUPR dams
- Existing hydroelectric infrastructure
- Hybrid operation with hydro brings benefits

3

Expansion potential

- Expansion supported by MPWH Regulation no. 7/2023
- 340% capacity increase from announced
- Further opportunities on natural water bodies

Rooftop Solar New Regulation

MEMR Regulation no. 2/2024

Capacity Limit:
15% of installed
electricity capacity

New Quota System:

- Allocation per system and sub-system
- Application every Jan & Jul
- 1.59 GW available for 2024-2028

Net metering:
1:1 Export-import

No Net Metering:

Electricity export from rooftop solar is not deducted from customer's bills

Rooftop Solar New Regulation

Impact of new regulation

New Quota System

No Net Metering

Study case		3.5 kWp residential	6.6 kWp commercial	200 kWp industrial
1:1 export - import scheme	IRR (%)	12.49%	9.81%	7.73%
	Total savings (USD)	15,303.60	24,660.66	532,644.72
Zero-export scheme	IRR (%)	4.94%	9.08%	7.73%
	Total savings (USD)	9,220.51	23,524.27	532,564.20
Savings difference (%)		-40%	-5%	-0.015%

Source: IESR analysis. Electricity price from October- December 2023 electricity tariff adjustment by PLN. Indonesian sectoral load curves from McNeil (2019).

- C&I customers eager to apply for quota allocation to maximise capacity
- Greater transparency needed in the quota reallocation process

- Residential customers would need alternative incentives
- Might trigger behavioural shift to rely on BESS

Captive Solar PV Power Plant

Drivers of Growth

Nickel, EV, Mining

- Capitalize on growing EV and battery market
- International market increasingly requiring sustainability across supply chain (e.g. EU battery passport)
- Sustainable practices can become competitive advantage

Utility Companies

- Rising trend of “Green Industrial Parks”
- MoI is formulating the regulation for Green Industrial Park criteria
- *Wilus* owners required to achieve electricity mix target in RUKN

Indonesia - Singapore Green Electricity Export

Companies Granted Conditional Licenses by Singaporean EMA (Energy Market Authority)

+ Conditional Approval granted to 2 companies for **1.4 GWac export**

**3.4 GWac
Total Export**

Opportunity for Indonesia

Domestic Solar Supply Chain Benefit through LCR

- MEMR Reg. no. 11/2024 art. 18 on determining minimum LCR for cross-border RE projects
- Planned to be 60% LCR
- Several CL grantees are in the process of partnering with global manufacturers to open production sites in Indonesia

Government-led Project

- Need legal basis to affirm PLN's role
- Gov. Reg. 42/2012 has requirements for cross-border energy trade but no specified roles
- MEMR Reg. no. 11/2021 regulates electricity export only for 5-year period, no guarantee for extension

Domestic Solar Supply Chain

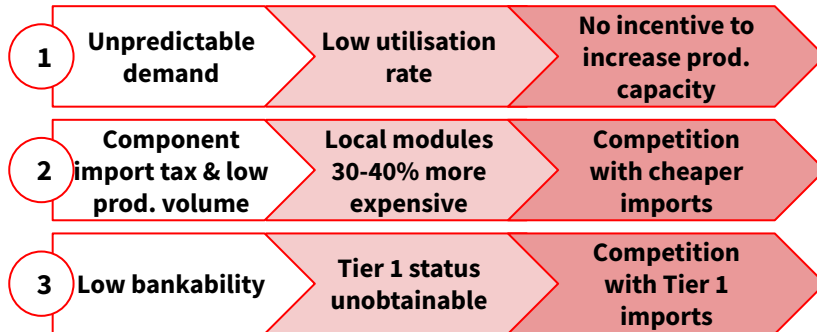

Solar PV Supply Chain

Indonesia solar module supply chain progress, June 2024

	Polysilicon production	Wafer production	Cell manufacturing	Module assembly
Existing	No available production capacity	No available production capacity	No available production capacity	2.3 GW annual production capacity
Construction		5 GW Annual production capacity	3.5 GW Annual production capacity	3.5 GW Annual production capacity
Planned/agreement signed	200,000 million tonnes Annual production capacity	6 GW Annual production capacity	13.5 GW Annual production capacity	15.5 GW Annual production capacity

Challenges

Drivers

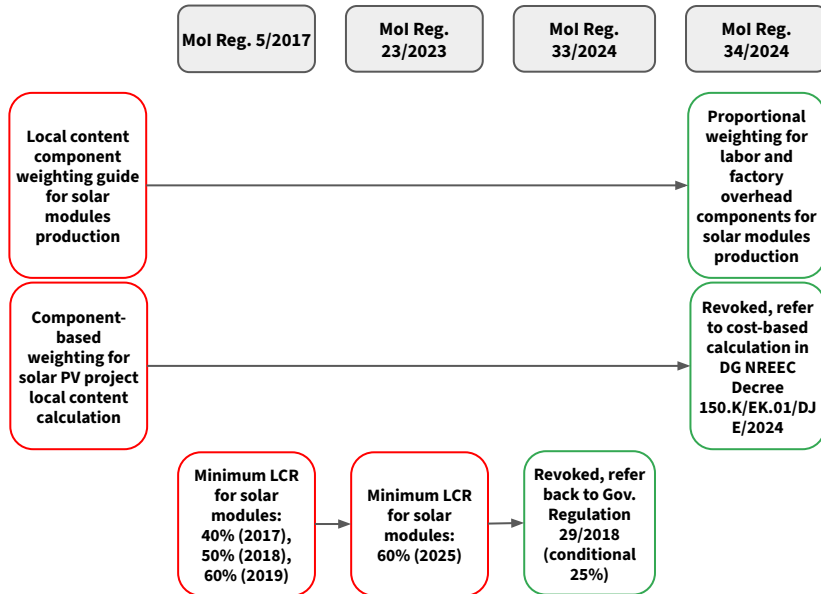

Domestic Solar Supply Chain

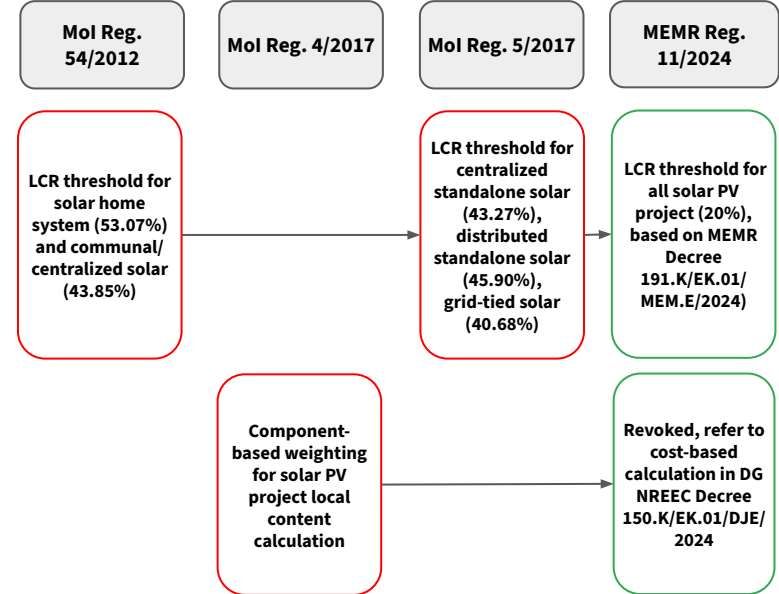

Local Content Requirement (LCR) Policy Dynamics

Regulation updates on minimum LCR for **solar module**

Regulation updates on minimum LCR for **solar projects**

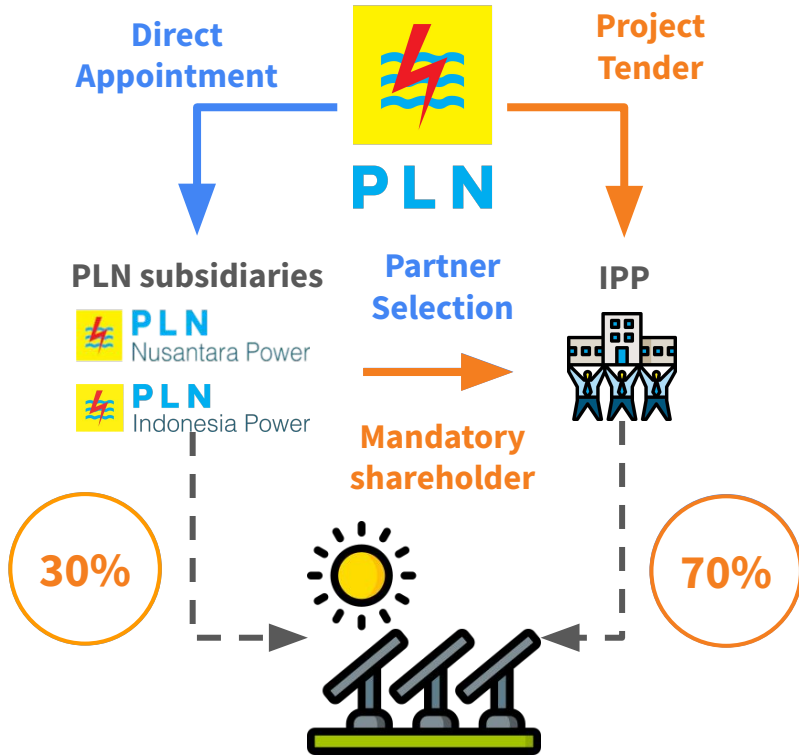

Nurturing Solar Energy Growth

Call to Actions to Keep Solar Momentum Going

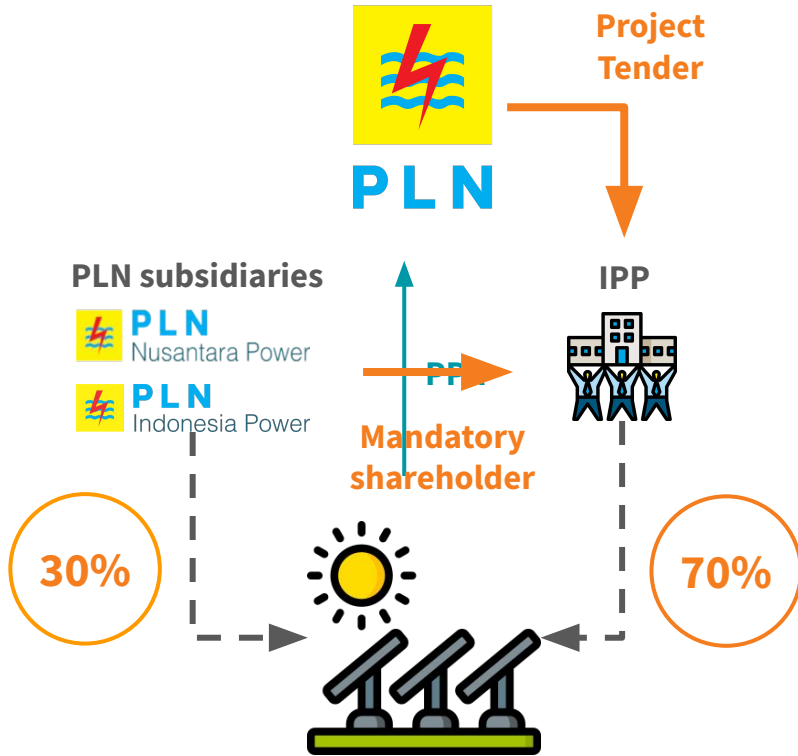

Building Strategic Partnership

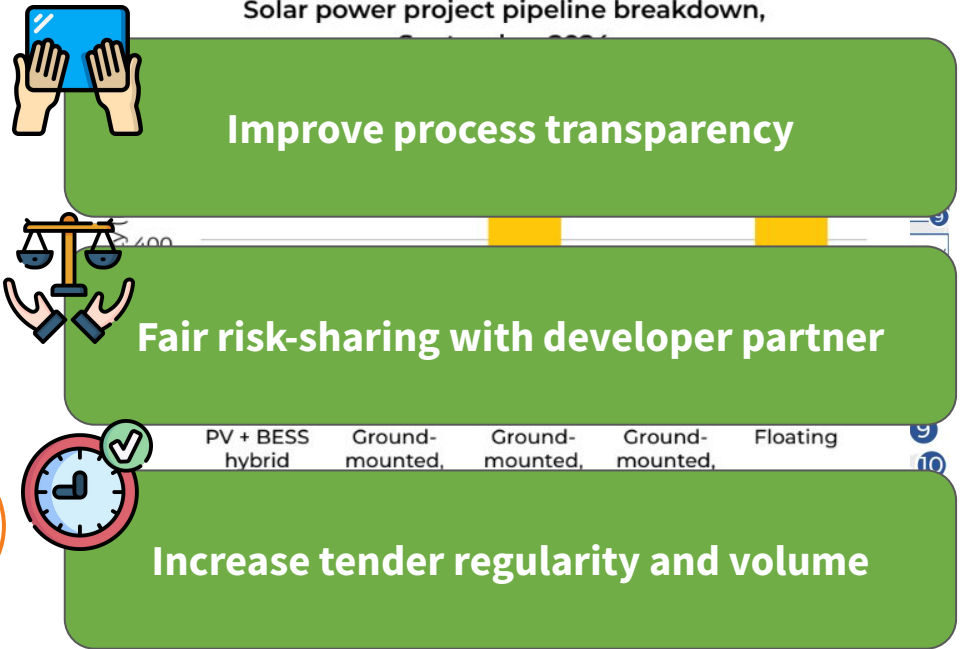

Minority Partnership Scheme (IPP owned)

541.6 MW

Building Strategic Partnership

Solar power project pipeline breakdown,

*Partnership PLN's subholding, but no specific scheme (majority/minority) mentioned.

Balancing The Grid

Planting needs and subsidy systemation in several rooftop PV penetration scenarios

Defining ancillary services in grid code

Establishing business model for ancillary services

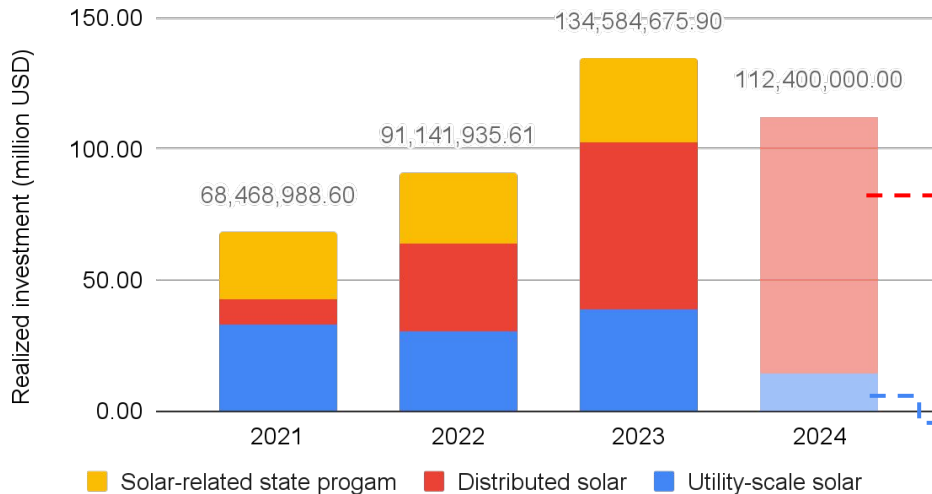

Updating distribution code to better involve distribution system operators

Utilizing fossil power plant flexibility

Fueling The Shift

Solar energy-related investment in Indonesia, 2021-2024 Q2

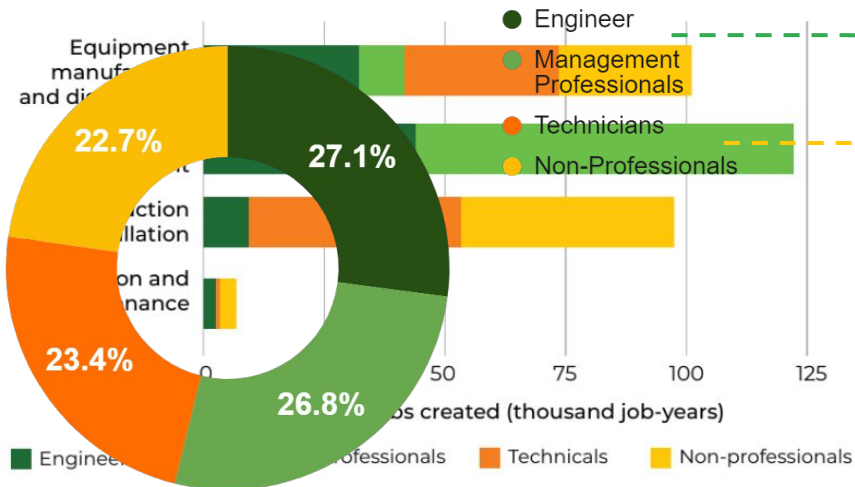

- MEMR Regulation 2/2024 has introduced market certainty
- Higher barrier-to-entry for certain market segments, **customer-side direct subsidy might be needed**

- Limited number of projects to be financed, but **big projects in the pipeline set to boost investment**
- LCR relaxation for development-financed projects might **improve access to low-cost financing**

Making the Shift Works

Proportion of direct jobs created from solar energy sector in Indonesia, 2020-2030 projection

Source: GGGI (2020)

- Ensuring a firm solar energy demand in the foreseeable future to **create strong industry fundamentals**
- Building **long-term partnership** between established **industry and academic institutions**

Regular vocational training in regional level to **increase access to trained labour**

Pushing Industrial Competitiveness

Lower LCR for Module & Projects

- + More solar projects due to ability to use cheaper imported modules
- Low incentive to invest in domestic products/ manufacturing

Global Brands Investing in Indonesia

- + Production capacity addition, strengthening domestic supply chain
- Risk of only being a factory site

Build Strong Solar Project Pipeline

- Ambitious planning in RUPTL
- Demand signaling
- Increase utilisation rate
- Increase prod. Volume
- Reduce prices

Explore Export Markets

- Make use of production capacity additions
- Capitalise on geopolitical advantages in some foreign markets

Invest in PV Technology R&D

- Ensure knowledge transfer from global companies
- Build workforce expertise

Develop Wafer & Cell Production

- Reduce dependency on imports
- Ease component import tax
- Reduce prices

**The year 2025 being the first reality checkpoint
of the new solar energy promise**
